Skandinavisk Elektrisk Transport System

An Interreg project
where we together
build the electrified
ports of the future

The SETS II project will help the ports of the regions to switch to electric power more quickly and thereby reduce carbon dioxide emissions.

One of our goals during the three-year long project period is that there should be an electrification strategy that all ports involved must translate into concrete solutions.

The projects wants the very "environmentally heavy" ports to be highlighted as positive role models. One way to do this is to find and use efficient and environmentally friendly solutions.

By working across borders in Denmark, Norway and Sweden, the actors can share each other's resources, experiences and knowledge in the field.

The collaboration is also intended to result in an opportunity to spread the project as widely as possible.

Together, we help ensure a green transition and increased competitiveness for our ports
